

1. Learn the Prerequisites

- Learn Python (best ecosystem for AI).
- You can also use JavaScript or other languages, but Python is easier because it has many AI frameworks.
- Learn how APIs work (calling APIs, authentication, handling responses).
- Build a few small projects using APIs.

2. Learn RAG (Retrieval-Augmented Generation)

- RAG helps you understand how LLMs actually work.
- Use frameworks like LlamaIndex.
- Learn concepts like:
 - Vector databases
 - Query engine
 - Chat engine
- Use open-source models like Llama 4.
- Example project:

Build an app where you upload a PDF and ask questions about it.

3. Learn AI Agents

- Build agents like SQL agents.
- Learn frameworks like Pydantic AI.
- Understand how agents:
 - Use tools
 - Take actions
- Solve tasks automatically.

4. Learn MCP Servers

- Learn Model Context Protocol (MCP).
- You can connect an MCP server to your product or application.
- Then users can chat with AI to control your product.

5. Learn LLM Deployment

- Learn how to deploy AI apps using platforms like RunPod.
- Understand:
 - GPU hosting
 - APIs for models
- Scaling AI applications.

☒ If you learn these steps and build projects along the way, you'll have a strong practical understanding of AI development.
